

ORF522 – Linear and Nonlinear Optimization

9. Sensitivity analysis for linear optimization

Bartolomeo Stellato – Fall 2021

$$\begin{array}{ll} \min & c^T x \\ \text{s.t.} & Ax \leq b \end{array}$$

Ed Forum

- Why does limiting it to the vertices make these problems deterministic strategies and no longer random? Is it just something to do with the problem having the same amount of variables as equations so everything can just be solved?
 - What are the advantages and disadvantages of the dual simplex method over the simplex method? For any linear optimization problem, is it always okay to use both the simplex and dual simplex methods? In what cases is it better to use the dual?
- Dual simplex questions:
 1. How can we prove if the primal problem is feasible and the duality gap is zero then the dual problem is also feasible?
 2. Under non-degenerate assumption, why $\bar{c}_N > 0$?
 3. What does "The dual simplex is equivalent to the primal simplex applied to the dual problem" means?
 4. We use the dual simplex method to solve the dual problem. So why the example in the slides finally output the optimal solution x^* ?
-

Recap

Optimal mixed strategies

P1: optimal strategy x^* is the solution of

$$\text{minimize}_{y \in P_n} \max x^T A y$$

$$\text{subject to } x \in P_m$$

P2: optimal strategy y^* is the solution of

$$\text{maximize}_{x \in P_m} \min x^T A y$$

$$\text{subject to } y \in P_n$$

Optimal mixed strategies

P1: optimal strategy x^* is the solution of

$$\begin{array}{ll} \text{minimize} & \max_{y \in P_n} x^T A y \\ \text{subject to} & x \in P_m \end{array} \longrightarrow \begin{array}{ll} \text{minimize} & \max_{j=1,\dots,n} (A^T x)_j \\ \text{subject to} & x \in P_m \end{array}$$

P2: optimal strategy y^* is the solution of

$$\begin{array}{ll} \text{maximize} & \min_{x \in P_m} x^T A y \\ \text{subject to} & y \in P_n \end{array} \longrightarrow \begin{array}{ll} \text{maximize} & \min_{i=1,\dots,m} (A y)_i \\ \text{subject to} & y \in P_n \end{array}$$

Optimal mixed strategies

P1: optimal strategy x^* is the solution of

$$\begin{array}{ll} \text{minimize} & \max_{y \in P_n} x^T A y \\ \text{subject to} & x \in P_m \end{array}$$

$$\begin{array}{ll} \text{minimize} & \max_{j=1,\dots,n} (A^T x)_j \\ \text{subject to} & x \in P_m \end{array}$$

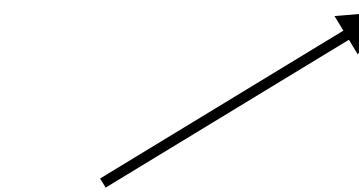

P2: optimal strategy y^* is the solution of

$$\begin{array}{ll} \text{maximize} & \min_{x \in P_m} x^T A y \\ \text{subject to} & y \in P_n \end{array}$$

$$\begin{array}{ll} \text{maximize} & \min_{i=1,\dots,m} (A y)_i \\ \text{subject to} & y \in P_n \end{array}$$

Inner problem over
deterministic
strategies (**vertices**)

Optimal mixed strategies

P1: optimal strategy x^* is the solution of

$$\begin{array}{ll} \text{maximize} & \min_{i=1,\dots,m} (Ay)_i \\ \text{subject to} & y \in P_n \end{array}$$

Inner problem over
deterministic
strategies (**vertices**)

Optimal strategies x^* and y^* can be computed using **linear optimization**

Minmax theorem

Theorem

$$\max_{y \in P_n} \min_{x \in P_m} x^T A y = \min_{x \in P_m} \max_{y \in P_n} x^T A y$$

Minmax theorem

Theorem

$$\max_{y \in P_n} \min_{x \in P_m} x^T A y = \min_{x \in P_m} \max_{y \in P_n} x^T A y$$

Proof

The optimal x^* is the solution of

$$\text{minimize } t$$

$$\text{subject to } A^T x \leq t \mathbf{1}$$

$$\mathbf{1}^T x = 1$$

$$x \geq 0$$

Minmax theorem

Theorem

$$\max_{y \in P_n} \min_{x \in P_m} x^T A y = \min_{x \in P_m} \max_{y \in P_n} x^T A y$$

Proof

The optimal x^* is the solution of

$$\text{minimize } t$$

$$\text{subject to } A^T x \leq t \mathbf{1}$$

$$\mathbf{1}^T x = 1$$

$$x \geq 0$$

The optimal y^* is the solution of

$$\text{maximize } w$$

$$\text{subject to } A y \geq w \mathbf{1}$$

$$\mathbf{1}^T y = 1$$

$$y \geq 0$$

Minmax theorem

Theorem

$$\max_{y \in P_n} \min_{x \in P_m} x^T A y = \min_{x \in P_m} \max_{y \in P_n} x^T A y$$

Proof

The optimal x^* is the solution of

$$\text{minimize } t$$

$$\text{subject to } A^T x \leq t \mathbf{1}$$

$$\mathbf{1}^T x = 1$$

$$x \geq 0$$

The optimal y^* is the solution of

$$\text{maximize } w$$

$$\text{subject to } A y \geq w \mathbf{1}$$

$$\mathbf{1}^T y = 1$$

$$y \geq 0$$

The two LPs are **duals** and by **strong duality** the equality follows. ■

General forms

Primal	Standard form LP	Dual
minimize $c^T x$		maximize $-b^T y$
subject to $Ax = b$ $x \geq 0$		subject to $A^T y + c \geq 0$

Primal	Inequality form LP	Dual
minimize $c^T x$		maximize $-b^T y$
subject to $Ax \leq b$		subject to $A^T y + c = 0$ $y \geq 0$

Today's lecture

[Chapter 5, Bertsimas and Tsitsiklis]

LO

Sensitivity analysis in linear optimization

- Adding new constraints and variables
- Change problem data
- Differentiable optimization

Adding new constraints and variables

Adding new variables

minimize $c^T x$

subject to $Ax = b$

$x \geq 0$

Solution x^*, y^*

Adding new variables

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & x \geq 0 \end{array} \longrightarrow \begin{array}{ll} \text{minimize} & c^T x + c_{n+1} x_{n+1} \\ \text{subject to} & Ax + A_{n+1} x_{n+1} = b \\ & x, x_{n+1} \geq 0 \end{array}$$

Solution x^*, y^*

Adding new variables

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & x \geq 0 \end{array} \longrightarrow \begin{array}{ll} \text{minimize} & c^T x + c_{n+1} x_{n+1} \\ \text{subject to} & Ax + A_{n+1} x_{n+1} = b \\ & x, x_{n+1} \geq 0 \end{array}$$

Solution x^*, y^*

Solution $(x^*, 0), y^*$ **optimal** for the new problem?

Adding new variables

Optimality conditions

minimize $c^T x + c_{n+1}x_{n+1}$

subject to $Ax + A_{n+1}x_{n+1} = b \longrightarrow$ Solution $(x^*, 0)$ is still **primal feasible**

$x, x_{n+1} \geq 0$

Adding new variables

Optimality conditions

$$\begin{aligned} & \max -b^T y \\ \text{st. } & A^T y + c \geq 0 \\ & A_{n+1}^T y + c_{n+1} \geq 0 \end{aligned}$$

minimize $c^T x + c_{n+1} x_{n+1}$

subject to $Ax + A_{n+1}x_{n+1} = b$ \longrightarrow Solution $(x^*, 0)$ is still **primal feasible**

$$x, x_{n+1} \geq 0$$

Is y^* still **dual feasible**?

$$A_{n+1}^T y^* + c_{n+1} \geq 0$$

Adding new variables

Optimality conditions

minimize $c^T x + c_{n+1}x_{n+1}$

subject to $Ax + A_{n+1}x_{n+1} = b \longrightarrow$ Solution $(x^*, 0)$ is still **primal feasible**

$x, x_{n+1} \geq 0$

Is y^* still **dual feasible**?

$$A_{n+1}^T y^* + c_{n+1} \geq 0$$

Yes

$(x^*, 0)$ still **optimal** for new problem

Otherwise

Primal simplex

Adding new variables

Example

$$\begin{aligned} \text{minimize} \quad & -60x_1 - 30x_2 - 20x_3 \\ \text{subject to} \quad & 8x_1 + 6x_2 + x_3 \leq 48 \\ & 4x_1 + 2x_2 + 1.5x_3 \leq 20 \\ & 2x_1 + 1.5x_2 + 0.5x_3 \leq 8 \\ & x \geq 0 \end{aligned}$$

Adding new variables

Example

$$\begin{array}{lll} \text{minimize} & -60x_1 - 30x_2 - 20x_3 & \text{-profit} \\ \text{subject to} & 8x_1 + 6x_2 + x_3 \leq 48 \\ & 4x_1 + 2x_2 + 1.5x_3 \leq 20 \\ & 2x_1 + 1.5x_2 + 0.5x_3 \leq 8 \\ & x \geq 0 \end{array}$$

Adding new variables

Example

minimize $-60x_1 - 30x_2 - 20x_3$ -profit

subject to $8x_1 + 6x_2 + x_3 \leq 48$ material

$$4x_1 + 2x_2 + 1.5x_3 \leq 20$$
$$2x_1 + 1.5x_2 + 0.5x_3 \leq 8$$
$$x \geq 0$$

Adding new variables

Example

minimize $-60x_1 - 30x_2 - 20x_3$ -profit

subject to $8x_1 + 6x_2 + x_3 \leq 48$ material

$4x_1 + 2x_2 + 1.5x_3 \leq 20$ production

$2x_1 + 1.5x_2 + 0.5x_3 \leq 8$

$x \geq 0$

Adding new variables

Example

minimize $-60x_1 - 30x_2 - 20x_3$ -profit

subject to $8x_1 + 6x_2 + x_3 \leq 48$ material

$4x_1 + 2x_2 + 1.5x_3 \leq 20$ production

$2x_1 + 1.5x_2 + 0.5x_3 \leq 8$ quality control

$$x \geq 0$$

Adding new variables

Example

minimize $-60x_1 - 30x_2 - 20x_3$ -profit
subject to $8x_1 + 6x_2 + x_3 \leq 48$ material
 $4x_1 + 2x_2 + 1.5x_3 \leq 20$ production
 $2x_1 + 1.5x_2 + 0.5x_3 \leq 8$ quality control
 $x \geq 0$

$$c = (-60, -30, -20, 0, 0, 0)$$

minimize $c^T x$

subject to $Ax = b$

$x \geq 0$

$$A = \begin{bmatrix} 8 & 6 & 1 & 1 & 0 & 0 \\ 4 & 2 & 1.5 & 0 & 1 & 0 \\ 2 & 1.5 & 0.5 & 0 & 0 & 1 \end{bmatrix}$$
$$b = (48, 20, 8)$$

Adding new variables

Example

minimize $-60x_1 - 30x_2 - 20x_3$ -profit
subject to $8x_1 + 6x_2 + x_3 \leq 48$ material
 $4x_1 + 2x_2 + 1.5x_3 \leq 20$ production
 $2x_1 + 1.5x_2 + 0.5x_3 \leq 8$ quality control
 $x \geq 0$

$$c = (-60, -30, -20, 0, 0, 0)$$

minimize $c^T x$
subject to $Ax = b$
 $x \geq 0$

$$A = \begin{bmatrix} 8 & 6 & 1 & 1 & 0 & 0 \\ 4 & 2 & 1.5 & 0 & 1 & 0 \\ 2 & 1.5 & 0.5 & 0 & 0 & 1 \end{bmatrix}$$
$$b = (48, 20, 8)$$

$$x^* = (2, 0, 8, 24, 0, 0), \quad y^* = (0, 10, 10), \quad c^T x^* = -280, \quad \text{basis } \{1, 3, 4\}$$

Adding new variables

Example: add new product?

$$\text{minimize} \quad c^T x + c_{n+1} x_{n+1}$$

$$\text{subject to} \quad Ax + A_{n+1}x_{n+1} = b$$

$$x, x_{n+1} \geq 0$$

$$c = (-60, -30, -20, 0, 0, 0, \underline{-15})$$

$$A = \begin{bmatrix} 8 & 6 & 1 & 1 & 0 & 0 & 1 \\ 4 & 2 & 1.5 & 0 & 1 & 0 & 1 \\ 2 & 1.5 & 0.5 & 0 & 0 & 1 & 1 \end{bmatrix}$$

$$b = (48, 20, 8)$$

Adding new variables

Example: add new product?

$$\text{minimize} \quad c^T x + c_{n+1} x_{n+1}$$

$$\text{subject to} \quad Ax + A_{n+1}x_{n+1} = b$$

$$x, x_{n+1} \geq 0$$

$$c = (-60, -30, -20, 0, 0, 0, -15)$$

$$A = \begin{bmatrix} 8 & 6 & 1 & 1 & 0 & 0 & 1 \\ 4 & 2 & 1.5 & 0 & 1 & 0 & 1 \\ 2 & 1.5 & 0.5 & 0 & 0 & 1 & 1 \end{bmatrix}$$

$$b = (48, 20, 8)$$

Previous solution

$$x^* = (2, 0, 8, 24, 0, 0), \quad y^* = (0, 10, 10), \quad c^T x^* = -280, \quad \text{basis } \{1, 3, 4\}$$

Adding new variables

~SO

Example: add new product?

$$\text{minimize} \quad c^T x + c_{n+1} x_{n+1}$$

$$\text{subject to} \quad Ax + A_{n+1}x_{n+1} = b$$

$$x, x_{n+1} \geq 0$$

$$c = (-60, -30, -20, 0, 0, 0, \underline{-15})$$

$$A = \begin{bmatrix} 8 & 6 & 1 & 1 & 0 & 0 & 1 \\ 4 & 2 & 1.5 & 0 & 1 & 0 & 1 \\ 2 & 1.5 & 0.5 & 0 & 0 & 1 & 1 \end{bmatrix}$$

$$b = (48, 20, 8)$$

Previous solution

$$x^* = (2, 0, 8, 24, 0, 0), \quad y^* = (0, 10, 10), \quad c^T x^* = -280, \quad \text{basis } \{1, 3, 4\}$$

Still optimal

$$A_{n+1}^T y^* + c_{n+1} = [1 \ 1 \ 1] \begin{bmatrix} 0 \\ 10 \\ 10 \end{bmatrix} - 15 = 5 \geq 0$$

$\cancel{-15} = 5 \geq 0$

$-60 \rightarrow 50$

Adding new variables

Example: add new product?

$$\text{minimize} \quad c^T x + c_{n+1} x_{n+1}$$

$$\text{subject to} \quad Ax + A_{n+1}x_{n+1} = b$$

$$x, x_{n+1} \geq 0$$

$$c = (-60, -30, -20, 0, 0, 0, -15)$$

$$A = \begin{bmatrix} 8 & 6 & 1 & 1 & 0 & 0 & 1 \\ 4 & 2 & 1.5 & 0 & 1 & 0 & 1 \\ 2 & 1.5 & 0.5 & 0 & 0 & 1 & 1 \end{bmatrix}$$

$$b = (48, 20, 8)$$

Previous solution

$$x^* = (2, 0, 8, 24, 0, 0), \quad y^* = (0, 10, 10), \quad c^T x^* = -280, \quad \text{basis } \{1, 3, 4\}$$

Still optimal

$$A_{n+1}^T y^* + c_{n+1} = [1 \ 1 \ 1] \begin{bmatrix} 0 \\ 10 \\ 10 \end{bmatrix} - 15 = 5 \geq 0$$

Shall we add a new product?

Adding new constraints

$$\begin{aligned} & \text{minimize} && c^T x \\ & \text{subject to} && Ax = b \\ & && x \geq 0 \end{aligned}$$

Solution x^*, y^*

Adding new constraints

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & x \geq 0 \end{array}$$

Solution x^*, y^*

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & a_{m+1}^T x = b_{m+1} \\ & x \geq 0 \end{array}$$

Adding new constraints

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & x \geq 0 \end{array}$$

Solution x^*, y^*

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & a_{m+1}^T x = b_{m+1} \\ & x \geq 0 \end{array}$$

Dual

$$\begin{array}{ll} \text{maximize} & -b^T y \\ \text{subject to} & A^T y + a_{m+1} y_{m+1} + c \geq 0 \end{array}$$

Adding new constraints

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & x \geq 0 \end{array}$$

Solution x^*, y^*

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & a_{m+1}^T x = b_{m+1} \\ & x \geq 0 \end{array}$$

Dual

$$\begin{array}{ll} \text{maximize} & -b^T y \\ \text{subject to} & A^T y + a_{m+1} y_{m+1} + c \geq 0 \end{array}$$

Solution $x^*, (y^*, 0)$ **optimal** for the new problem?

Adding new constraints

Optimality conditions

maximize $-b^T y$

subject to $A^T y + \boxed{a_{m+1}y_{m+1}} + c \geq 0$ \longrightarrow Solution $(y^*, 0)$ is still dual feasible

Adding new constraints

Optimality conditions

maximize $-b^T y$

subject to $A^T y + a_{m+1}y_{m+1} + c \geq 0$ \longrightarrow Solution $(y^*, 0)$ is still **dual feasible**

Is x^* still **primal feasible**?

$$Ax = b$$

$$a_{m+1}^T x = b_{m+1}$$

$$x \geq 0$$

Adding new constraints

Optimality conditions

maximize $-b^T y$

subject to $A^T y + a_{m+1}y_{m+1} + c \geq 0$ \longrightarrow Solution $(y^*, 0)$ is still **dual feasible**

Is x^* still **primal feasible**?

$$Ax = b$$

$$a_{m+1}^T x = b_{m+1}$$

$$x \geq 0$$

Yes

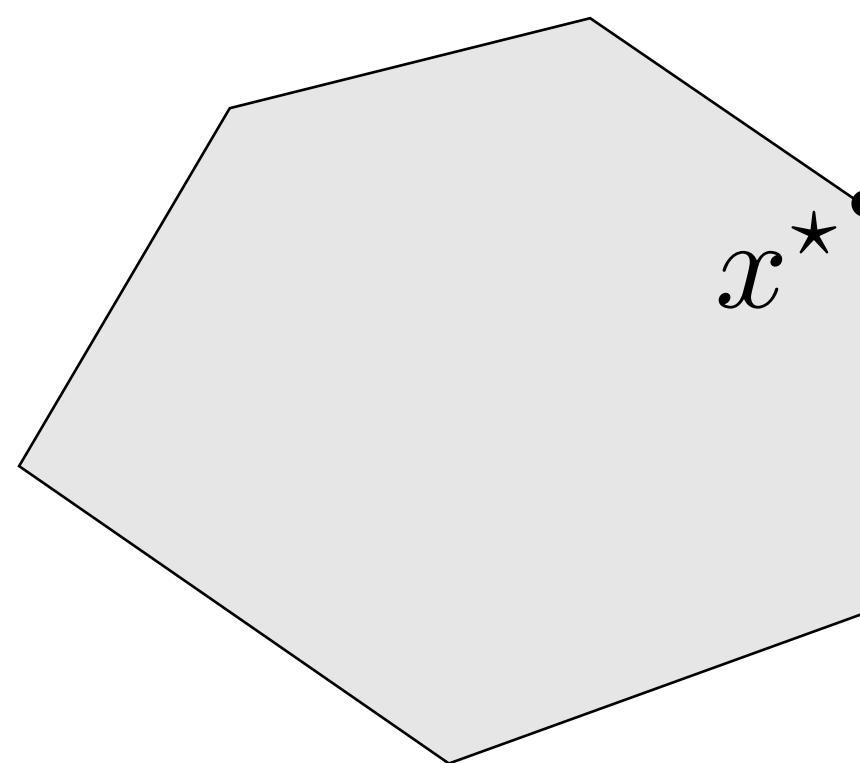

x^* still **optimal** for new problem

Otherwise

Dual simplex

Adding new constraints

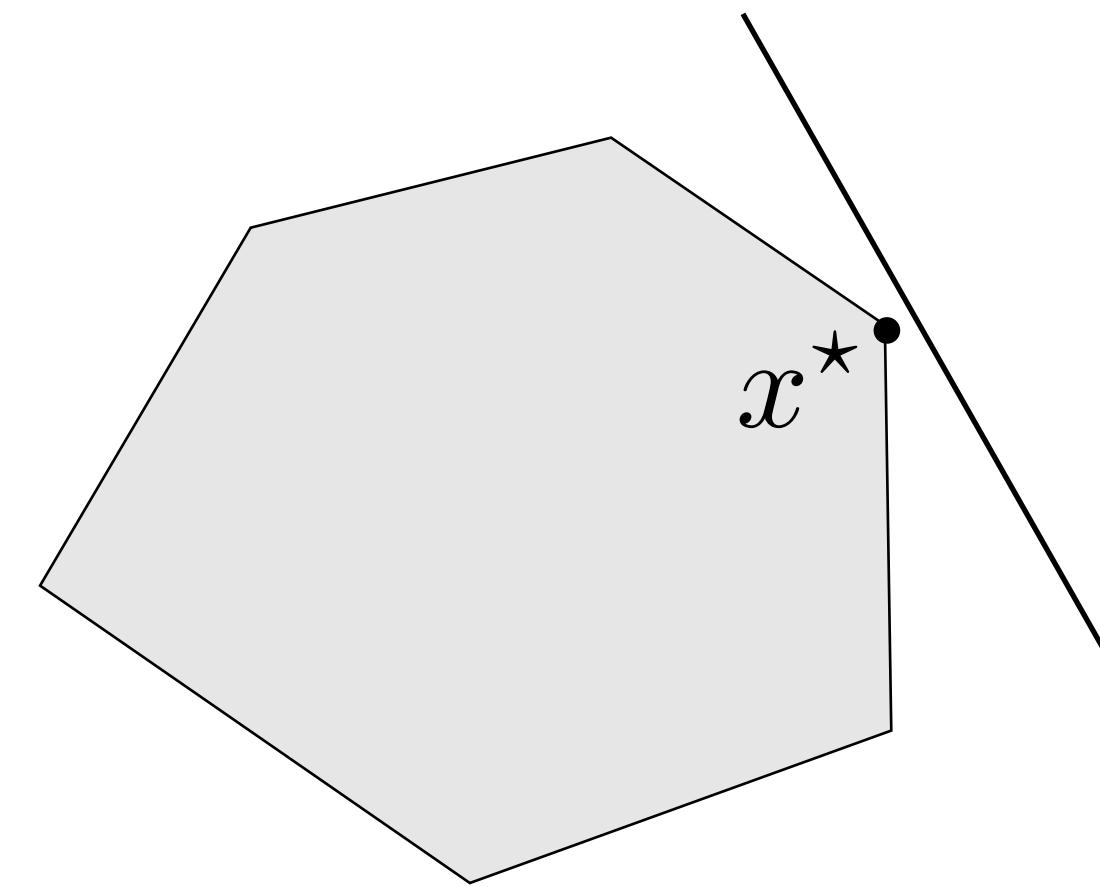

Example

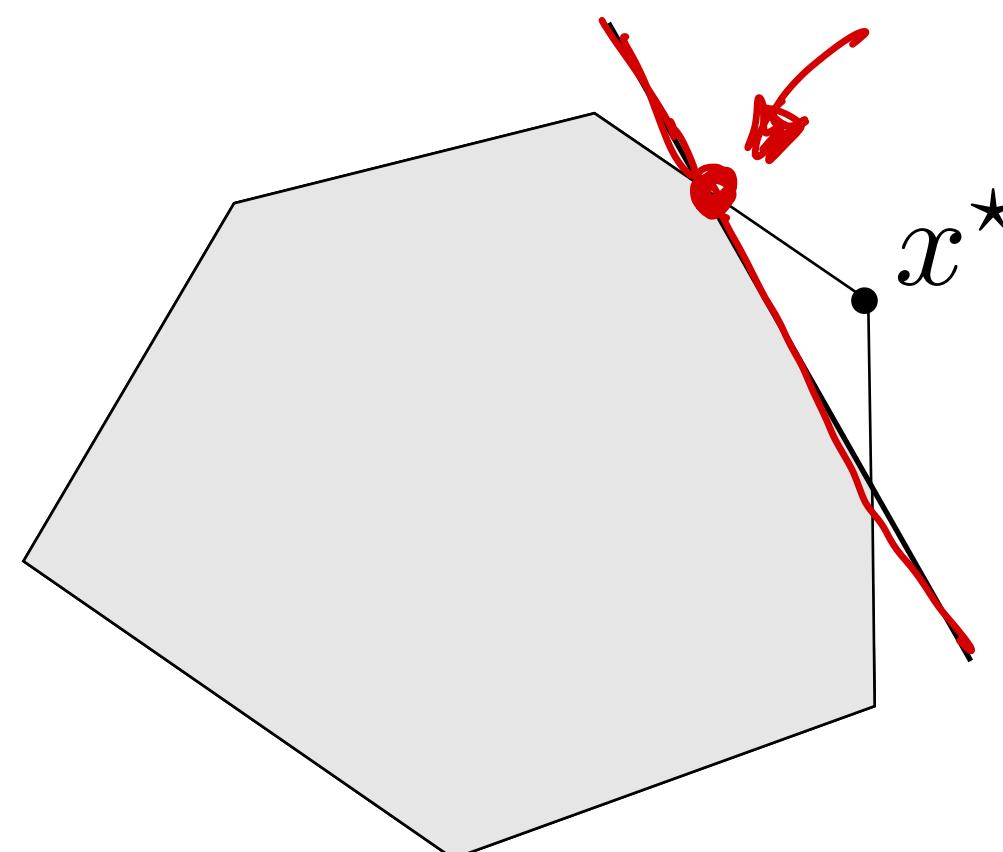

Add new constraint

x^* still feasible

x^* infeasible

Global sensitivity analysis

Information from primal-dual solution

Goal: extract information from x^*, y^* about their sensitivity with respect to changes in problem data

Modified LP

$$\begin{aligned} \text{minimize} \quad & c^T x \\ \text{subject to} \quad & Ax = b + u \\ & x \geq 0 \end{aligned}$$

Optimal cost $p^*(u)$

Global sensitivity

Dual of modified LP

$$\begin{aligned} \text{maximize} \quad & -(b + u)^T y \\ \text{subject to} \quad & A^T y + c \geq 0 \end{aligned}$$

Global sensitivity

Dual of modified LP

$$\begin{aligned} & \text{maximize} && -(b + u)^T y \\ & \text{subject to} && A^T y + c \geq 0 \end{aligned}$$

Global lower bound

Given y^* a dual optimal solution for $u = 0$, then

$$\begin{aligned} p^*(u) &\geq -(b + u)^T y^* && \text{(from weak duality and} \\ &= p^*(0) - u^T y^* && \text{dual feasibility)} \end{aligned}$$

$$-b^T y^* = d^*(0) = p^*(0)$$

Global sensitivity

Dual of modified LP

$$\begin{aligned} \text{maximize} \quad & -(b + u)^T y \\ \text{subject to} \quad & A^T y + c \geq 0 \end{aligned}$$

Global lower bound

Given y^* a dual optimal solution for $u = 0$, then

$$\begin{aligned} p^*(u) &\geq -(b + u)^T y^* && \text{(from weak duality and} \\ &= p^*(0) - u^T y^* && \text{dual feasibility)} \end{aligned}$$

It holds for any u

Global sensitivity

Example

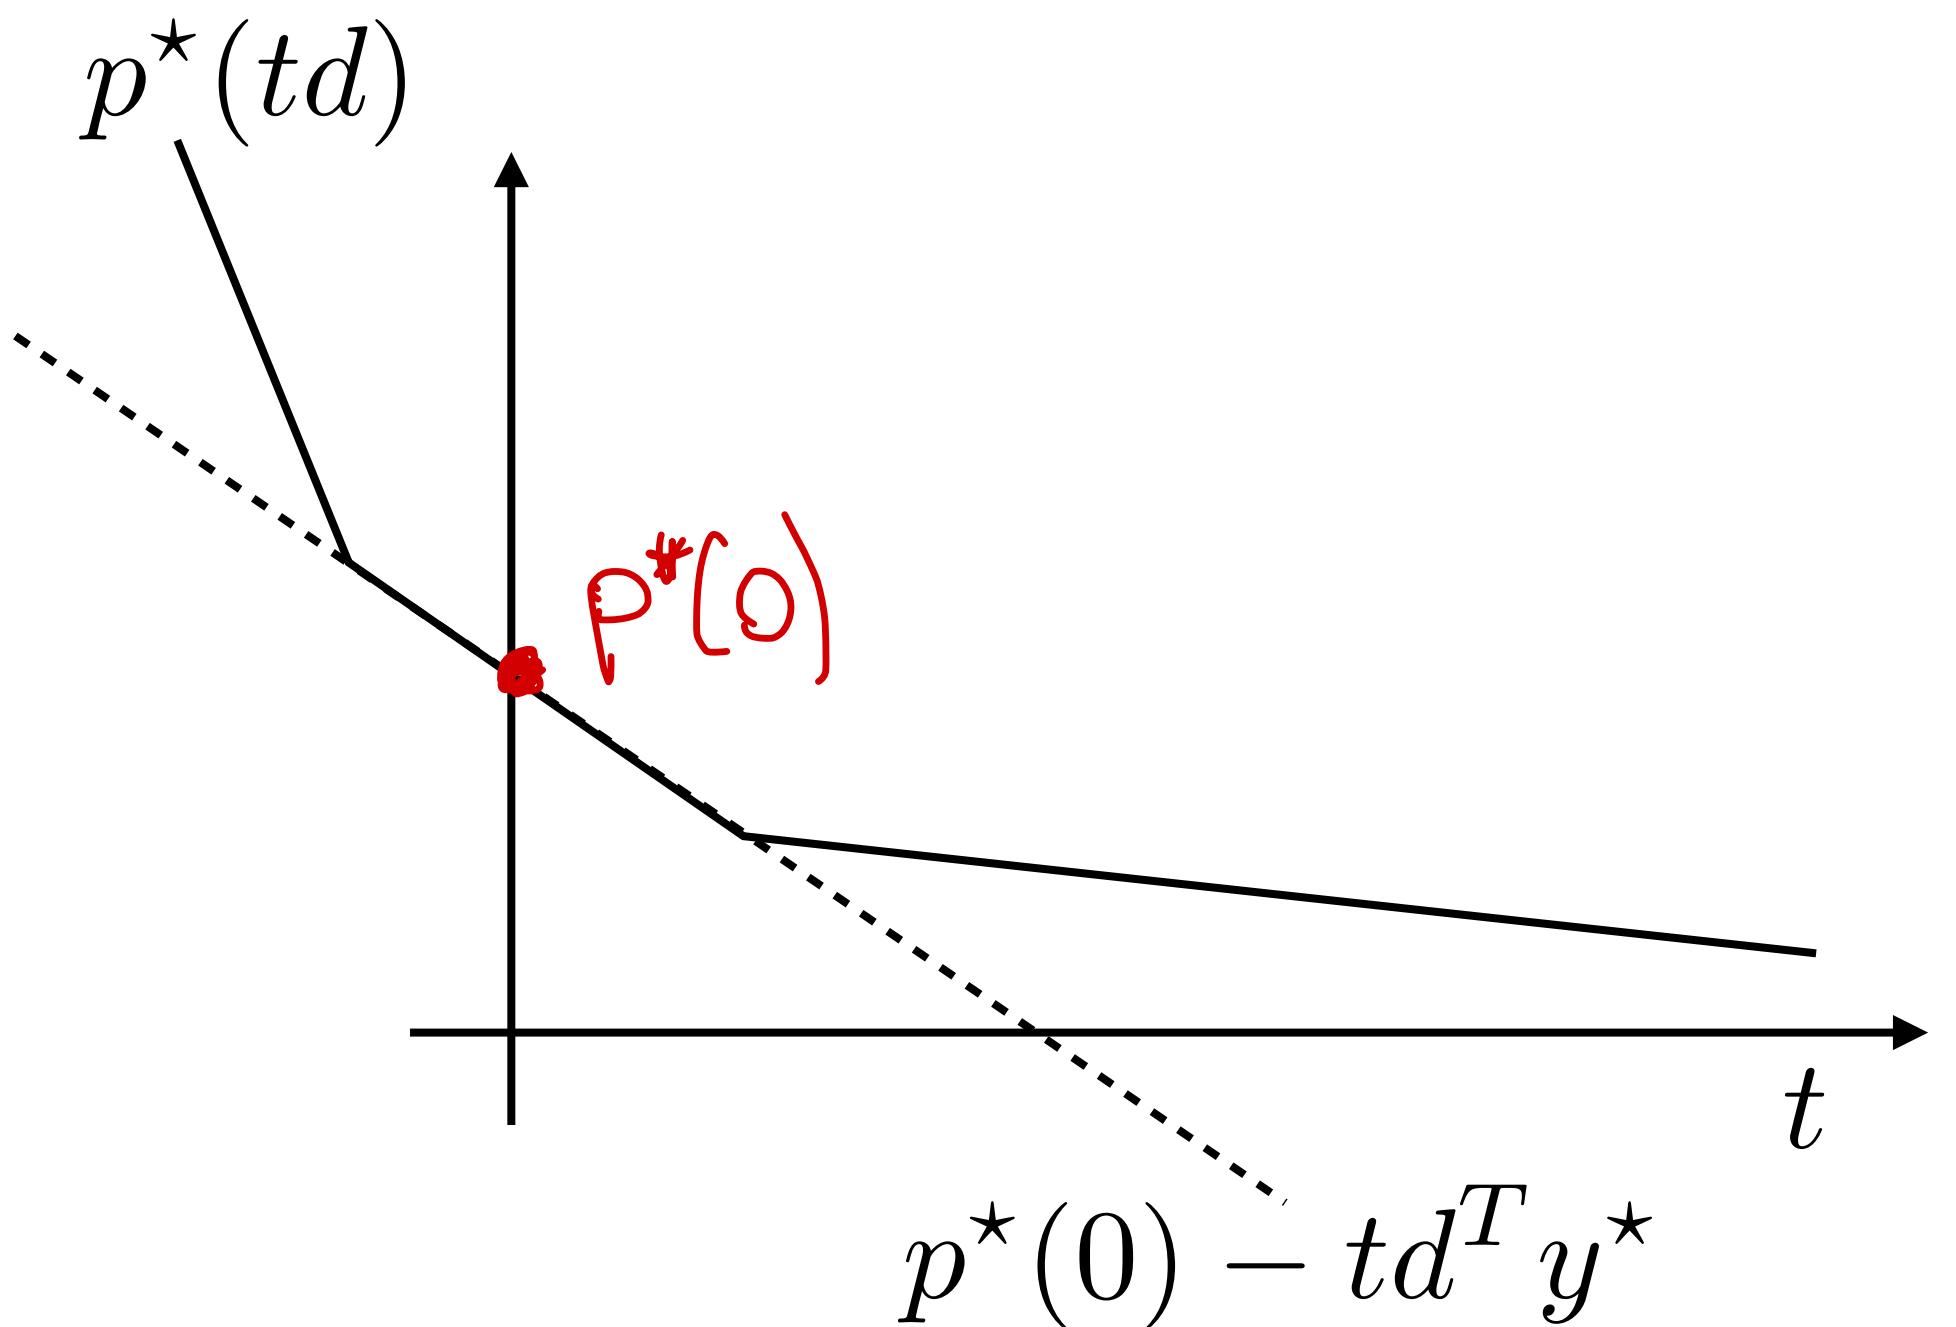

Take $u = td$ with $d \in \mathbf{R}^m$ fixed

minimize $c^T x$

subject to $Ax = b + td$

$x \geq 0$

$p^*(td)$ is the optimal value as a function of t

Global sensitivity

Example

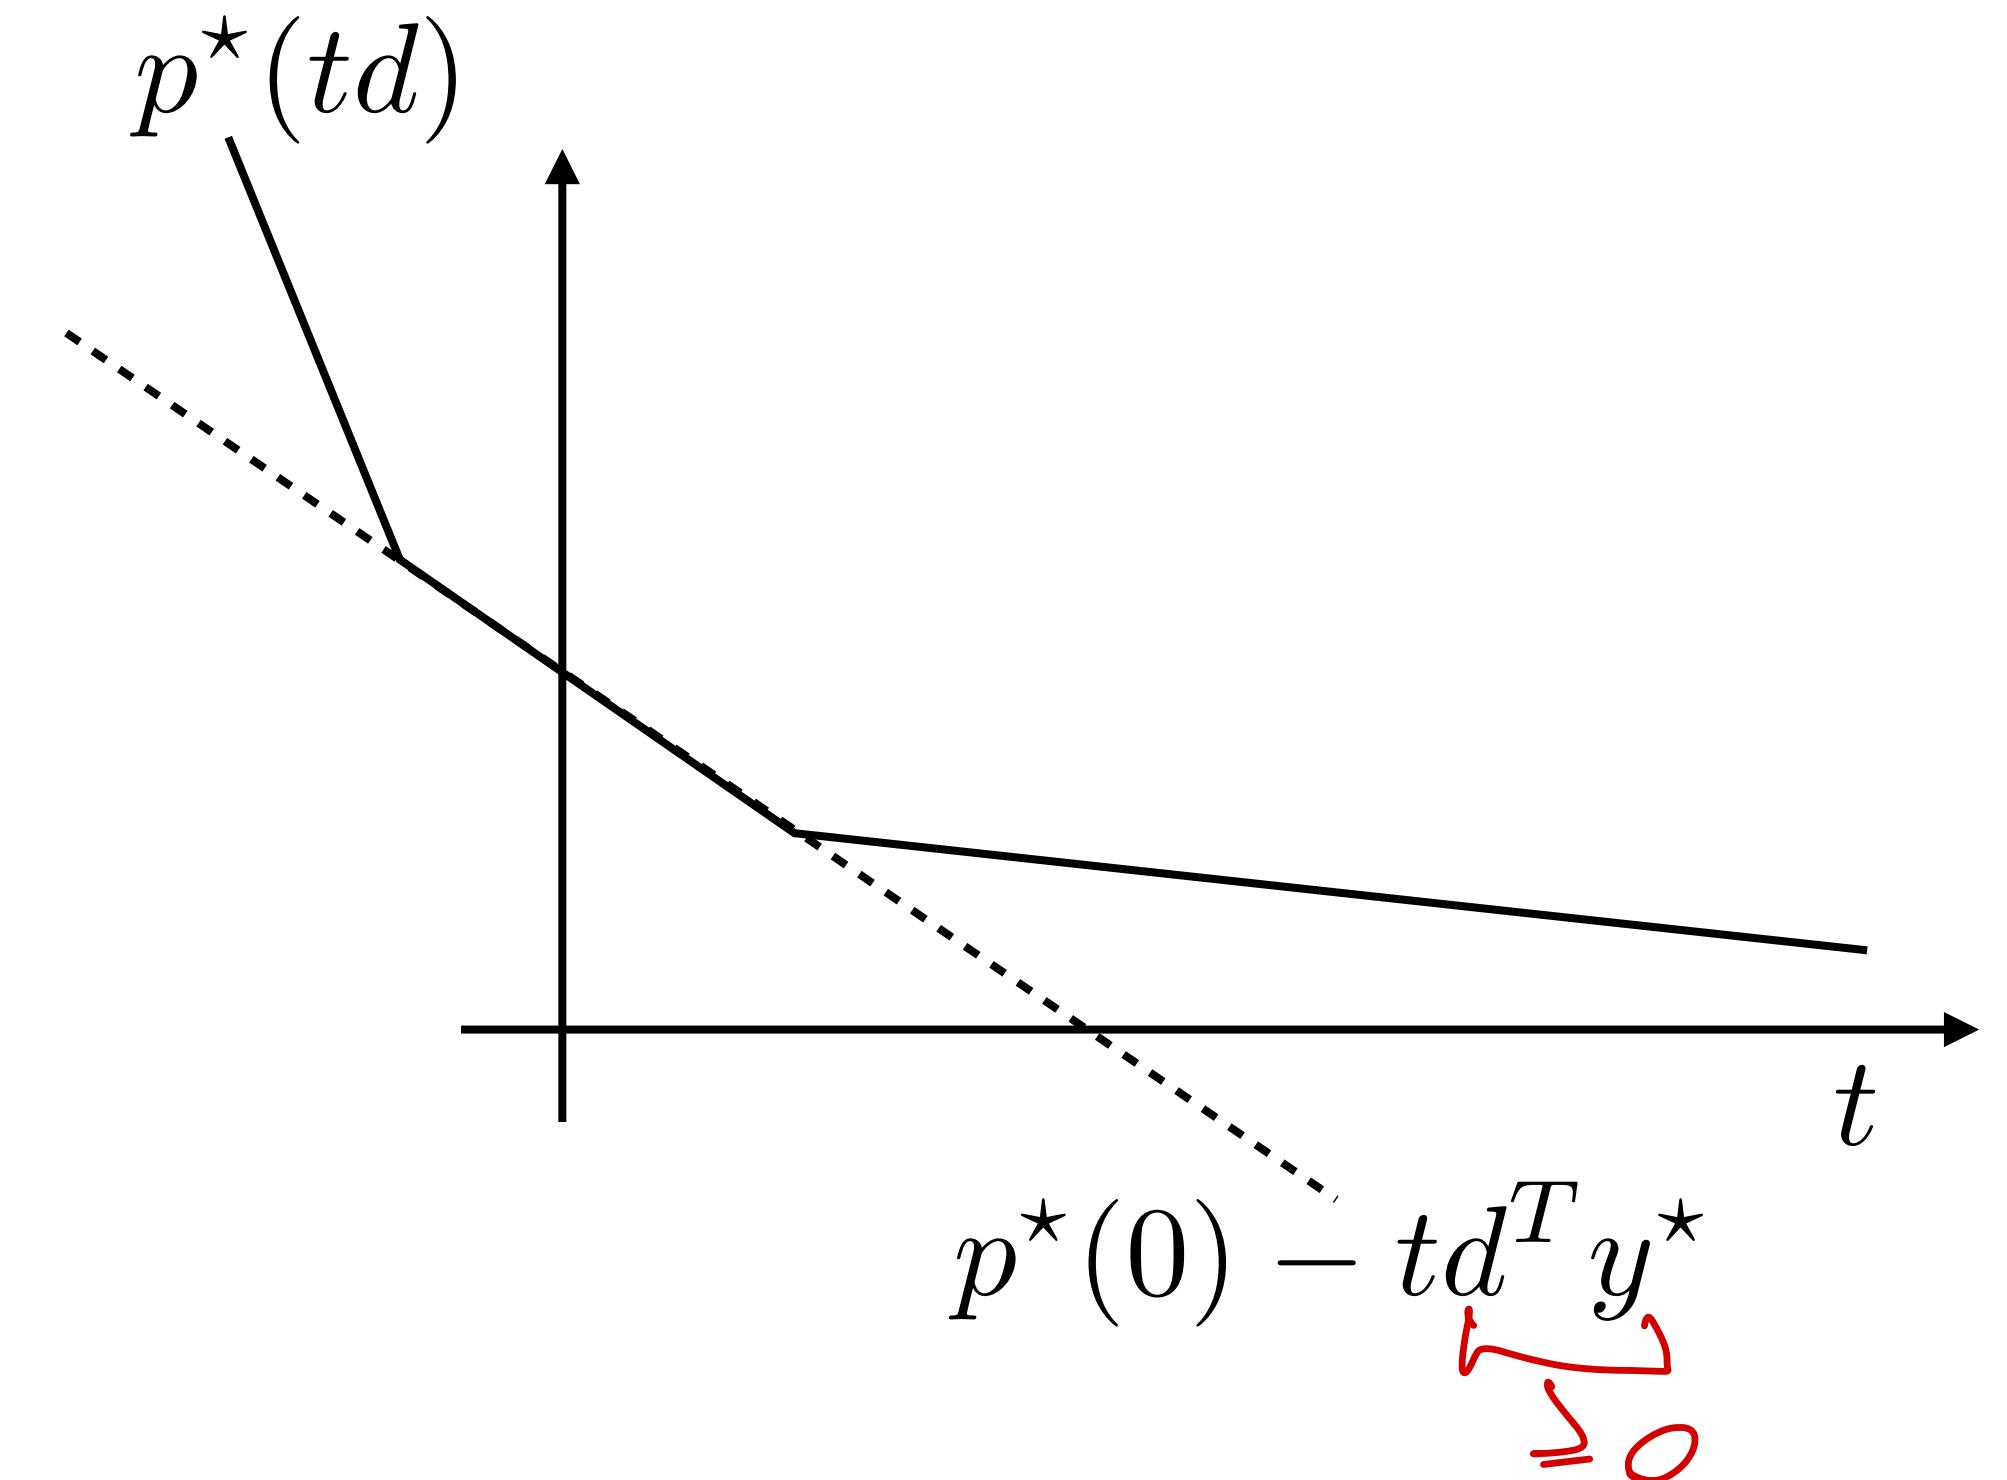

Take $u = td$ with $d \in \mathbf{R}^m$ fixed

$$\text{minimize} \quad c^T x$$

$$\text{subject to} \quad Ax = b + td$$

$$x \geq 0$$

$p^*(td)$ is the optimal value as a function of t

Sensitivity information (assuming $d^T y^* \geq 0$)

- $t < 0$ the optimal value increases
- $t > 0$ the optimal value decreases (not so much if t is small)

Optimal value function

$$p^*(u) = \min\{c^T x \mid Ax = b + u, x \geq 0\}$$

Assumption: $p^*(0)$ is finite

Properties

- $p^*(u) > -\infty$ everywhere (from global lower bound)
- the domain $\{u \mid p^*(u) < +\infty\}$ is a polyhedron
- $p^*(u)$ is piecewise-linear on its domain

Optimal value function is piecewise linear

Proof

$$p^*(u) = \min\{c^T x \mid Ax = b + u, x \geq 0\}$$

Optimal value function is piecewise linear

Proof

$$p^*(u) = \min\{c^T x \mid Ax = b + u, x \geq 0\}$$

Dual feasible set

$$D = \{y \mid A^T y + c \geq 0\}$$

Assumption: $p^*(0)$ is finite

Optimal value function is piecewise linear

Proof

Dual feasible set

$$p^*(u) = \min\{c^T x \mid Ax = b + u, x \geq 0\} \quad D = \{y \mid A^T y + c \geq 0\}$$

Assumption: $p^*(0)$ is finite

If $p^*(u)$ finite

$$p^*(u) = \max_{y \in D} -(b + u)^T y = \max_{k=1, \dots, r} -y_k^T u + b^T y_k$$

y_1, \dots, y_r are the extreme points of D

Local sensitivity analysis

Local sensitivity u in neighborhood of the origin

Original LP

$$\text{minimize} \quad c^T x$$

$$\text{subject to} \quad Ax = b$$

$$x \geq 0$$

Optimal solution

Primal

$$x_i = 0, \quad i \notin B$$

$$x_B^\star = A_B^{-1} b$$

Dual

$$y^\star = -A_B^{-T} c_B$$

Local sensitivity u in neighborhood of the origin

Original LP

$$\text{minimize} \quad c^T x$$

$$\text{subject to} \quad Ax = b$$

$$x \geq 0$$

Optimal solution

Primal

$$x_i = 0, \quad i \notin B$$

$$x_B^* = A_B^{-1} b$$

Dual

$$y^* = -A_B^{-T} c_B$$

Modified LP

$$\text{minimize} \quad c^T x$$

$$\text{subject to} \quad Ax = b + u$$

$$x \geq 0$$

Modified dual

$$\text{maximize} \quad -(b + u)^T y$$

$$\text{subject to} \quad A^T y + c \geq 0$$

**Optimal basis
does not change**

Local sensitivity u in neighborhood of the origin

Original LP

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b \\ & x \geq 0 \end{array}$$

Optimal solution

$$\begin{array}{ll} \text{Primal} & x_i = 0, \quad i \notin B \\ & x_B^* = A_B^{-1} b \\ \text{Dual} & y^* = -A_B^{-T} c_B \end{array}$$

Modified LP

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax = b + u \\ & x \geq 0 \end{array}$$

Modified dual

$$\begin{array}{ll} \text{maximize} & -(b + u)^T y \\ \text{subject to} & A^T y + c \geq 0 \end{array}$$

**Optimal basis
does not change**

Modified optimal solution

$$\begin{aligned} x_B^*(u) &= A_B^{-1}(b + u) = x_B^* + A_B^{-1}u \\ y^*(u) &= y^* \end{aligned}$$

Derivative of the optimal value function

Modified optimal solution

$$\begin{aligned}x_B^*(u) &= A_B^{-1}(b + u) = x_B^* + A_B^{-1}u \\y^*(u) &= y^*\end{aligned}$$

Derivative of the optimal value function

Modified optimal solution

$$\begin{aligned}x_B^*(u) &= A_B^{-1}(b + u) = \underbrace{x_B^*}_{c} + A_B^{-1}u \\y^*(u) &= y^*\end{aligned}$$

Optimal value function

$$\begin{aligned}p^*(u) &= c^T x^*(u) \quad \cancel{+ b^T} \\&= c^T x^* + \boxed{c_B^T A_B^{-1} u} \quad \cancel{- y^*} \\&= p^*(0) - y^{*T} u \quad (\text{affine for small } u)\end{aligned}$$

Derivative of the optimal value function

Modified optimal solution

$$\begin{aligned}x_B^*(u) &= A_B^{-1}(b + u) = x_B^* + A_B^{-1}u \\y^*(u) &= y^*\end{aligned}$$

Optimal value function

$$\begin{aligned}p^*(u) &= c^T x^*(u) \\&= c^T x^* + c_B^T A_B^{-1} u \\&= p^*(0) - y^{*T} u \quad (\text{affine for small } u)\end{aligned}$$

Local derivative

$$\frac{\partial p^*(u)}{\partial u} = -y^* \quad (y^* \text{ are the shadow prices})$$

Sensitivity example

$$\begin{aligned} \text{minimize} \quad & -60x_1 - 30x_2 - 20x_3 \\ \text{subject to} \quad & 8x_1 + 6x_2 + x_3 \leq 48 \\ & 4x_1 + 2x_2 + 1.5x_3 \leq 20 \\ & 2x_1 + 1.5x_2 + 0.5x_3 \leq 8 \\ & x \geq 0 \end{aligned}$$

Sensitivity example

$$\begin{array}{lll} \text{minimize} & -60x_1 - 30x_2 - 20x_3 & \text{-profit} \\ \text{subject to} & 8x_1 + 6x_2 + x_3 \leq 48 \\ & 4x_1 + 2x_2 + 1.5x_3 \leq 20 \\ & 2x_1 + 1.5x_2 + 0.5x_3 \leq 8 \\ & x \geq 0 \end{array}$$

Sensitivity example

$$\begin{array}{ll} \text{minimize} & -60x_1 - 30x_2 - 20x_3 \\ \text{subject to} & 8x_1 + 6x_2 + x_3 \leq 48 \\ & 4x_1 + 2x_2 + 1.5x_3 \leq 20 \\ & 2x_1 + 1.5x_2 + 0.5x_3 \leq 8 \\ & x \geq 0 \end{array}$$

-profit
material

Sensitivity example

minimize	$-60x_1 - 30x_2 - 20x_3$	-profit
subject to	$8x_1 + 6x_2 + x_3 \leq 48$	material
	$4x_1 + 2x_2 + 1.5x_3 \leq 20$	production
	$2x_1 + 1.5x_2 + 0.5x_3 \leq 8$	
	$x \geq 0$	

Sensitivity example

minimize	$-60x_1 - 30x_2 - 20x_3$	-profit
subject to	$8x_1 + 6x_2 + x_3 \leq 48$	material
	$4x_1 + 2x_2 + 1.5x_3 \leq 20$	production
	$2x_1 + 1.5x_2 + 0.5x_3 \leq 8$	quality control
	$x \geq 0$	

Sensitivity example

$$\begin{array}{lll} \text{minimize} & -60x_1 - 30x_2 - 20x_3 & \text{-profit} \\ \text{subject to} & 8x_1 + 6x_2 + x_3 \leq 48 & \text{material} \\ & 4x_1 + 2x_2 + 1.5x_3 \leq 20 & \text{production} \\ & 2x_1 + 1.5x_2 + 0.5x_3 \leq 8 & \text{quality control} \\ & x \geq 0 & \end{array}$$

$$x^* = (\underline{2}, 0, 8, \overline{24}, 0, 0), \quad y^* = (0, 10, 10), \quad c^T x^* = \cancel{-280}, \quad \text{basis } \{1, 3, 4\}$$

Sensitivity example

minimize	$-60x_1 - 30x_2 - 20x_3$	-profit
subject to	$8x_1 + 6x_2 + x_3 \leq 48$	material
	$4x_1 + 2x_2 + 1.5x_3 \leq 20$	production
	$2x_1 + 1.5x_2 + 0.5x_3 \leq 8$	quality control
	$x \geq 0$	

$$x^* = (2, 0, 8, 24, 0, 0), \quad y^* = (0, 10, 10), \quad c^T x^* = -280, \quad \text{basis } \{1, 3, 4\}$$

What does $y_3^* = 10$ mean?

Sensitivity example

minimize	$-60x_1 - 30x_2 - 20x_3$	-profit
subject to	$8x_1 + 6x_2 + x_3 \leq 48$	material
	$4x_1 + 2x_2 + 1.5x_3 \leq 20$	production
	$2x_1 + 1.5x_2 + 0.5x_3 \leq 8$	quality control
	$x \geq 0$	

$$x^* = (2, 0, 8, 24, 0, 0), \quad y^* = (0, 10, 10), \quad c^T x^* = -280, \quad \text{basis } \{1, 3, 4\}$$

What does $y_3^* = 10$ mean?

Let's increase the quality control budget by 1, i.e., $u = (0, 0, 1)$

$$p^*(\overset{\textcolor{red}{u}}{u}) = p^*(0) - y^{*T} u = -280 - 10 = -290$$

Differentiable optimization

Training a neural network

Single layer model

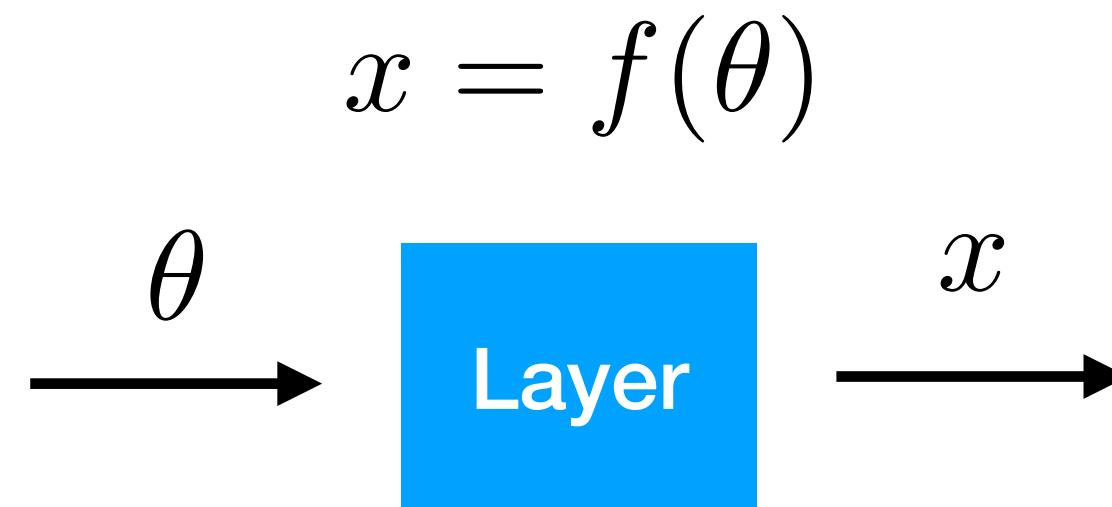

$$x = f(\theta)$$

Can f be an **optimization problem**?

Training a neural network

Single layer model

Training

$$\text{minimize } \mathcal{L}(\theta)$$

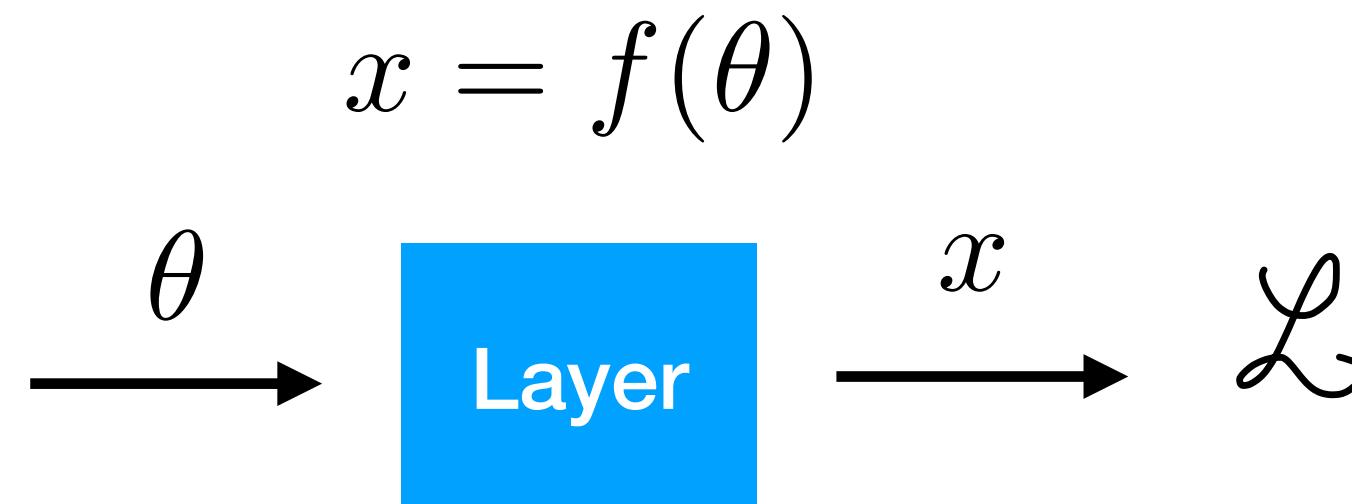

Gradient descent (more on this later)

$$\theta \leftarrow \theta - t \nabla_{\theta} \mathcal{L}(\theta)$$

Can f be an **optimization problem**?

Training a neural network

Single layer model

Training

$$\text{minimize } \mathcal{L}(\theta)$$

Gradient descent (more on this later)

$$\theta \leftarrow \theta - t \nabla_{\theta} \mathcal{L}(\theta)$$

Sensitivity

$$\nabla_{\theta} \mathcal{L} = \left(\frac{\partial \mathcal{L}}{\partial \theta} \right)^T = \left(\frac{\partial \mathcal{L}}{\partial x} \frac{\partial x}{\partial \theta} \right)^T = \left(\frac{\partial x}{\partial \theta} \right)^T \nabla_x \mathcal{L}$$

Can f be an **optimization problem**?

Implicit layers

<https://implicit-layers-tutorial.org/>

$$\begin{array}{ll} \text{find} & x(\theta) \\ \text{subject to} & r(\theta, x(\theta)) = 0 \end{array}$$

($x(\theta)$ is implicitly defined by r)

Implicit layers

<https://implicit-layers-tutorial.org/>

find $x(\theta)$
subject to $r(\theta, x(\theta)) = 0$ $(x(\theta) \text{ is implicitly defined by } r)$

How do we compute derivatives?

$$\frac{\partial x(\theta)}{\partial \theta}$$

Implicit layers

<https://implicit-layers-tutorial.org/>

find $x(\theta)$
subject to $r(\theta, x(\theta)) = 0$ $(x(\theta)$ is implicitly defined by r)

How do we compute derivatives?

$$\frac{\partial x(\theta)}{\partial \theta}$$

Implicit function theorem

Under mild assumptions (non-singularity),

$$\frac{\partial r(\theta, x(\theta))}{\partial x} \frac{\partial x(\theta)}{\partial \theta} + \frac{\partial r(\theta, x(\theta))}{\partial \theta} = 0 \longrightarrow \frac{\partial x(\theta)}{\partial \theta} = - \left(\frac{\partial r(\theta, x(\theta))}{\partial x} \right)^{-1} \frac{\partial r(\theta, x(\theta))}{\partial \theta}$$

Optimization layers

$$x^*(\theta) = \underset{x}{\operatorname{argmin}} \quad c^T x$$

subject to $Ax \leq b$

Parameters: $\theta = \{c, A, b\}$
Solution $x^*(\theta)$

Optimization layers

$$x^*(\theta) = \underset{x}{\operatorname{argmin}} \quad c^T x \\ \text{subject to} \quad Ax \leq b$$

Parameters: $\theta = \{c, A, b\}$
Solution $x^*(\theta)$

Features

- Add **domain knowledge** and **hard constraints**
- **End-to-end** training and optimization
- Nice theory and algorithms for general **convex optimization**
- **Applications** in RL, control, meta-learning, game theory, etc.

Optimization layers

$$\begin{aligned} x^*(\theta) = \operatorname{argmin}_x & c^T x \\ \text{subject to } & Ax \leq b \end{aligned}$$

Parameters: $\theta = \{c, A, b\}$
Solution $x^*(\theta)$

Features

- Add **domain knowledge** and **hard constraints**
- **End-to-end** training and optimization
- Nice theory and algorithms for general **convex optimization**
- **Applications** in RL, control, meta-learning, game theory, etc.

Goal

Compute $\frac{\partial x^*(\theta)}{\partial \theta}$

Optimality conditions

$$\begin{array}{ll}\text{minimize} & c^T x \\ \text{subject to} & Ax \leq b\end{array}$$

Parameters: $\theta = \{c, A, b\}$
Solution $x^*(\theta)$

Solve and obtain primal-dual pair x^*, y^* (forward-pass)

Optimality conditions

$$A^T y + c = 0$$

$$\text{diag}(y)(Ax - b) = 0$$

$$y \geq 0, \quad b - Ax \geq 0$$

Optimality conditions

$$\begin{array}{ll}\text{minimize} & c^T x \\ \text{subject to} & Ax \leq b\end{array}$$

Parameters: $\theta = \{c, A, b\}$
Solution $x^*(\theta)$

Solve and obtain primal-dual pair x^*, y^* (forward-pass)

Optimality conditions

$$\begin{aligned}A^T y + c &= 0 \\ \text{diag}(y)(Ax - b) &= 0\end{aligned}$$

$$y \geq 0, \quad b - Ax \geq 0$$

Mapping $r(\theta, x(\theta)) = 0$

Computing derivatives

Take differentials

$$\begin{array}{ccc} A^T y^* + c = 0 & \xrightarrow{\hspace{1cm}} & dA^T y^* + A^T dy = 0 \\ \text{diag}(y^*)(Ax - b) = 0 & & \text{diag}(Ax - b)dy + \text{diag}(y^*)(dAx^* + Adx - db) = 0 \end{array}$$

Computing derivatives

Take differentials

$$\begin{array}{ccc} A^T y^* + c = 0 & \xrightarrow{\hspace{1cm}} & dA^T y^* + A^T dy = 0 \\ \text{diag}(y^*)(Ax - b) = 0 & & \text{diag}(Ax - b)dy + \text{diag}(y^*)(dAx^* + Adx - db) = 0 \end{array}$$

Linear system

$$\begin{bmatrix} 0 & A^T \\ \text{diag}(y^*)A & \text{diag}(Ax^* - b) \end{bmatrix} \begin{bmatrix} dx \\ dy \end{bmatrix} = - \begin{bmatrix} dA^T y^* + dc \\ \text{diag}(y^*)(dAx^* - db) \end{bmatrix}$$

Computing derivatives

$$\begin{aligned} A^T y^* + c &= 0 \\ \text{diag}(y^*)(Ax - b) &= 0 \end{aligned}$$

Take differentials

$$\begin{aligned} dA^T y^* + A^T dy &\stackrel{+dc}{=} 0 \\ \text{diag}(Ax - b)dy + \text{diag}(y^*)(dAx^* + Adx - db) &= 0 \end{aligned}$$

Linear system

$$\begin{bmatrix} 0 & A^T \\ \text{diag}(y^*)A & \text{diag}(Ax^* - b) \end{bmatrix} \begin{bmatrix} dx \\ dy \end{bmatrix} = - \begin{bmatrix} dA^T y^* + dc \\ \text{diag}(y^*)(dAx^* - db) \end{bmatrix}$$

Example: How does x^* change with b_1 ?

Set $db = e_1$, $dA = 0$, $dc = 0$ and solve the linear system.

The solution dx will correspond to $\frac{\partial x}{\partial b_1}$

Is it always differentiable?

The linear system matrix must be invertible
(the problem must have unique solution)

$$\begin{bmatrix} 0 & A^T \\ \text{diag}(y^*)A & \text{diag}(Ax^* - b) \end{bmatrix} \begin{bmatrix} dx \\ dy \end{bmatrix} = - \begin{bmatrix} dA^T y^* + dc \\ \text{diag}(y^*)(dAx^* - db) \end{bmatrix}$$
$$M \qquad \qquad \qquad q$$

Is it always differentiable?

The linear system matrix must be invertible
(the problem must have unique solution)

$$\begin{bmatrix} 0 & A^T \\ \text{diag}(y^*)A & \text{diag}(Ax^* - b) \end{bmatrix} \begin{bmatrix} dx \\ dy \end{bmatrix} = - \begin{bmatrix} dA^T y^* + dc \\ \text{diag}(y^*)(dAx^* - db) \end{bmatrix}$$
$$M \qquad \qquad \qquad q$$

Remember. implicit function theorem

$$\frac{\partial x(\theta)}{\partial \theta} = - \left(\frac{\partial r(\theta, x(\theta))}{\partial x} \right)^{-1} \frac{\partial r(\theta, x(\theta))}{\partial \theta}$$

Is it always differentiable?

The linear system matrix must be invertible
(the problem must have unique solution)

$$\begin{bmatrix} 0 & A^T \\ \text{diag}(y^*)A & \text{diag}(Ax^* - b) \end{bmatrix} \begin{bmatrix} dx \\ dy \end{bmatrix} = - \begin{bmatrix} dA^T y^* + dc \\ \text{diag}(y^*)(dAx^* - db) \end{bmatrix}$$
$$M \qquad \qquad \qquad q$$

Remember. implicit function theorem

$$\frac{\partial x(\theta)}{\partial \theta} = - \left(\frac{\partial r(\theta, x(\theta))}{\partial x} \right)^{-1} \frac{\partial r(\theta, x(\theta))}{\partial \theta}$$

If not, **least squares** “subdifferential”

$$\text{minimize} \quad \left\| M \begin{bmatrix} dx \\ dy \end{bmatrix} + q \right\|_2^2$$

Example

Learning to play Sudoku

			3
1			
		4	
4			1

2	4	1	3
1	3	2	4
3	1	4	2
4	2	3	1

Sudoku constraint satisfaction problem

minimize 0

subject to $Ax = b$

$x \geq 0, x \in \mathbf{Z}^d$

Example

Learning to play Sudoku

			3
1			
		4	
4			1

2	4	1	3
1	3	2	4
3	1	4	2
4	2	3	1

Sudoku constraint satisfaction problem

$$\text{minimize} \quad 0$$

$$\text{subject to} \quad Ax = b$$

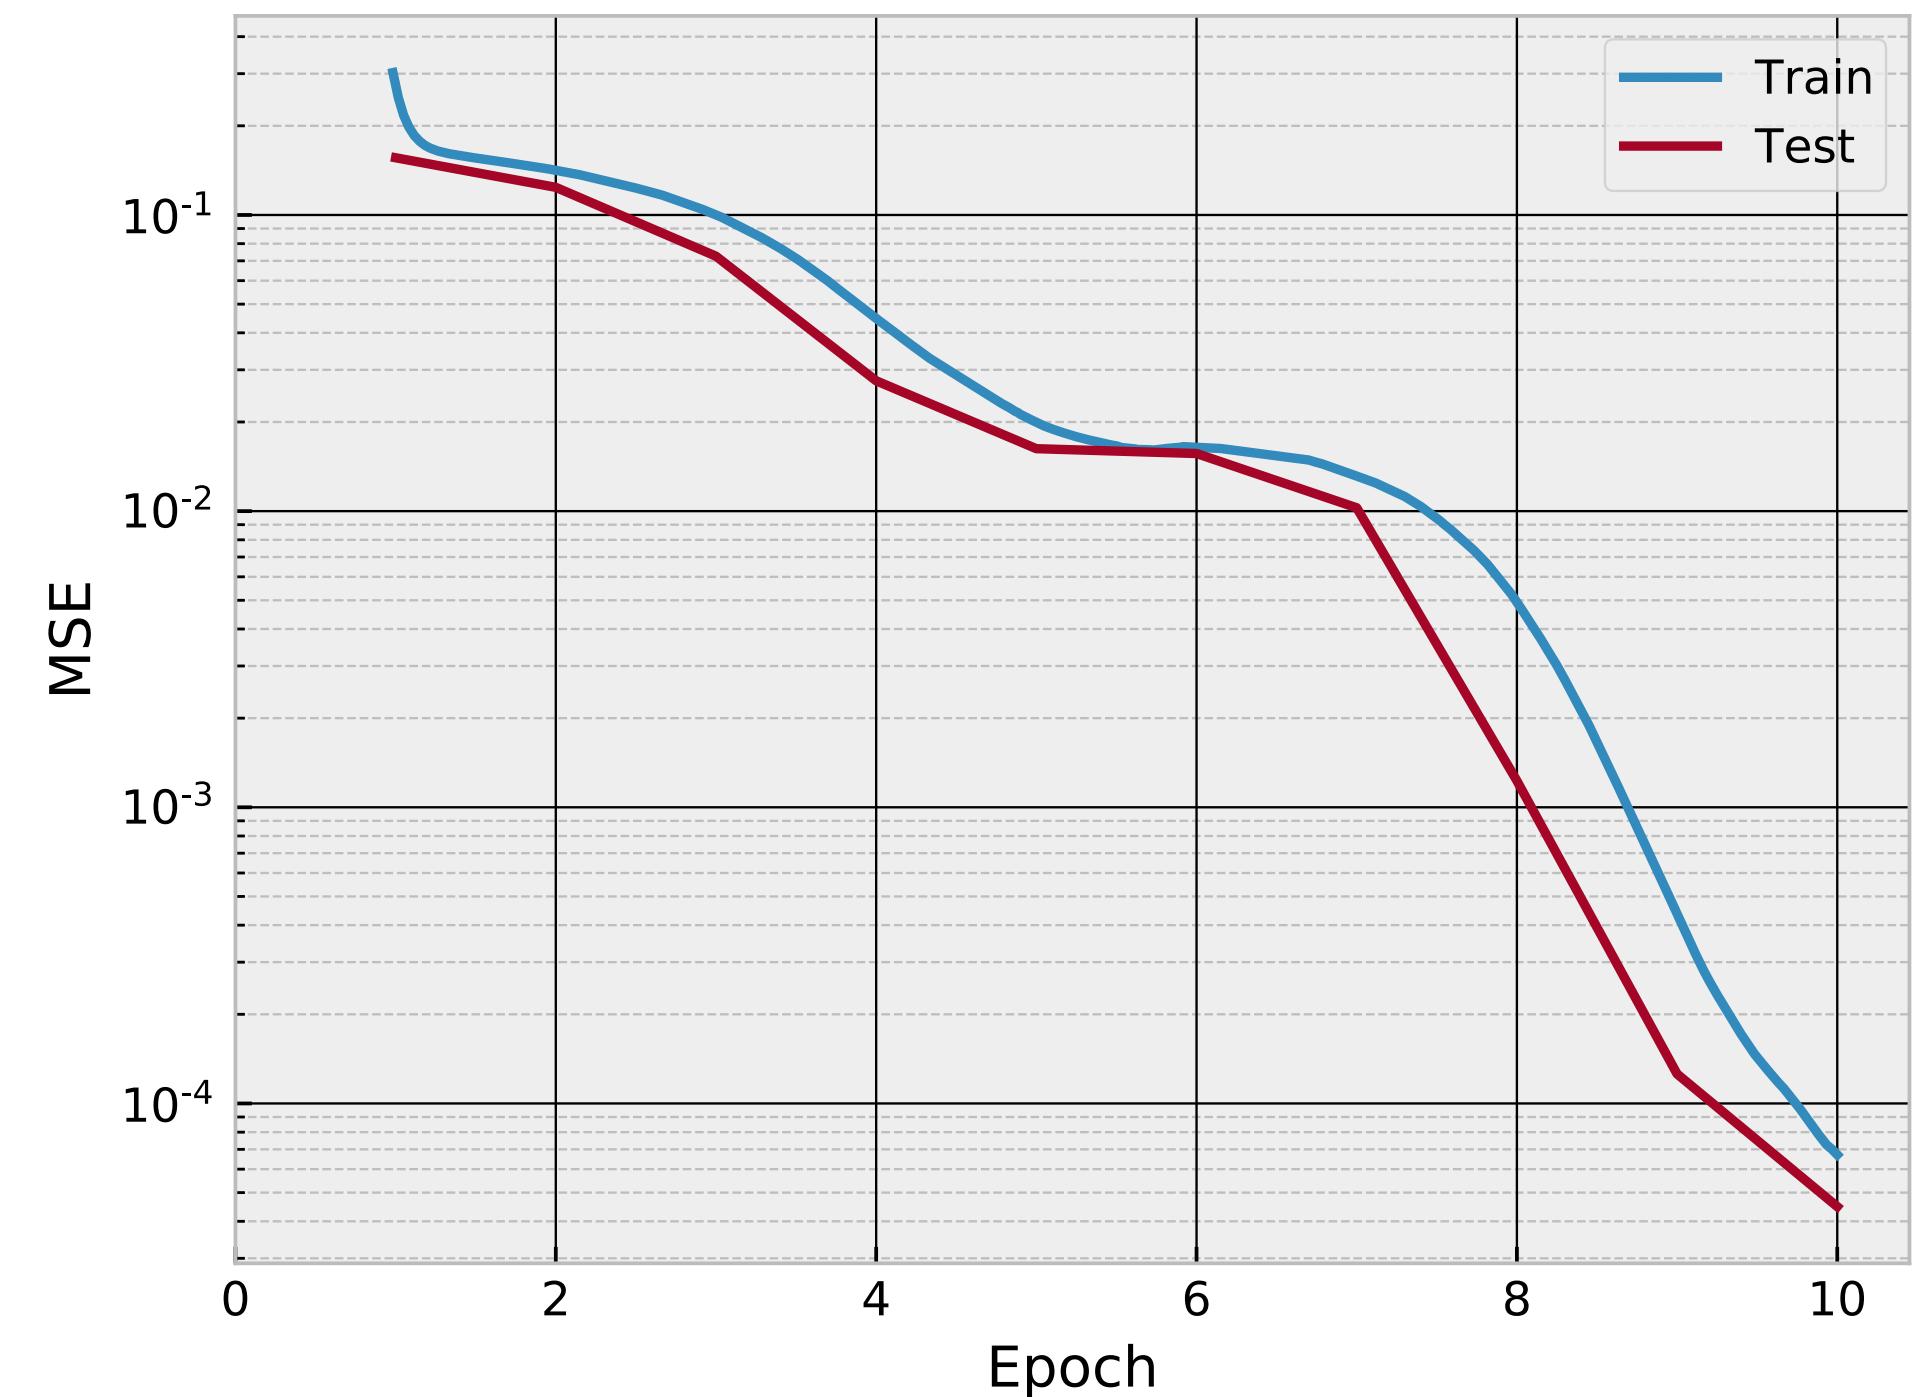

$$x \geq 0, \quad x \in \mathbf{Z}^d$$

Linear optimization layer (parameters $\theta = \{A, b\}$)

$$x^* = \underset{x}{\operatorname{argmin}} \quad 0$$

$$\text{subject to} \quad Ax = b$$

$$x \geq 0$$

Sensitivity analysis in linear optimization

Today, we learned to:

- **Use** the most appropriate primal/dual simplex algorithm when variables and/or constraints are added
- **Analyze** sensitivity of the cost with respect to change in the data
- **Apply** sensitivity analysis to differentiable linear optimization layers

Next lecture

- Barrier methods for linear optimization
